

-  NutriSmart is a soil nutrition alternative which is based on the activity of six specialised yeast contained in an easy to use granule.
-  When planting, it is applied into the soil where it stimulates plant root growth significantly and increases the plant root biomass. This enhances soil nutrient uptake efficiency, making available soil and applied fertilisers.
-  Bioactivity in the soil is improved, reducing the effects of plant pathogens and soil diseases, providing healthier plants with better quality yields.

Fresh market production of potatoes at Mount Gambier.

Over 3 years average pack out of premium increased from 55% of tonnage to 70%.

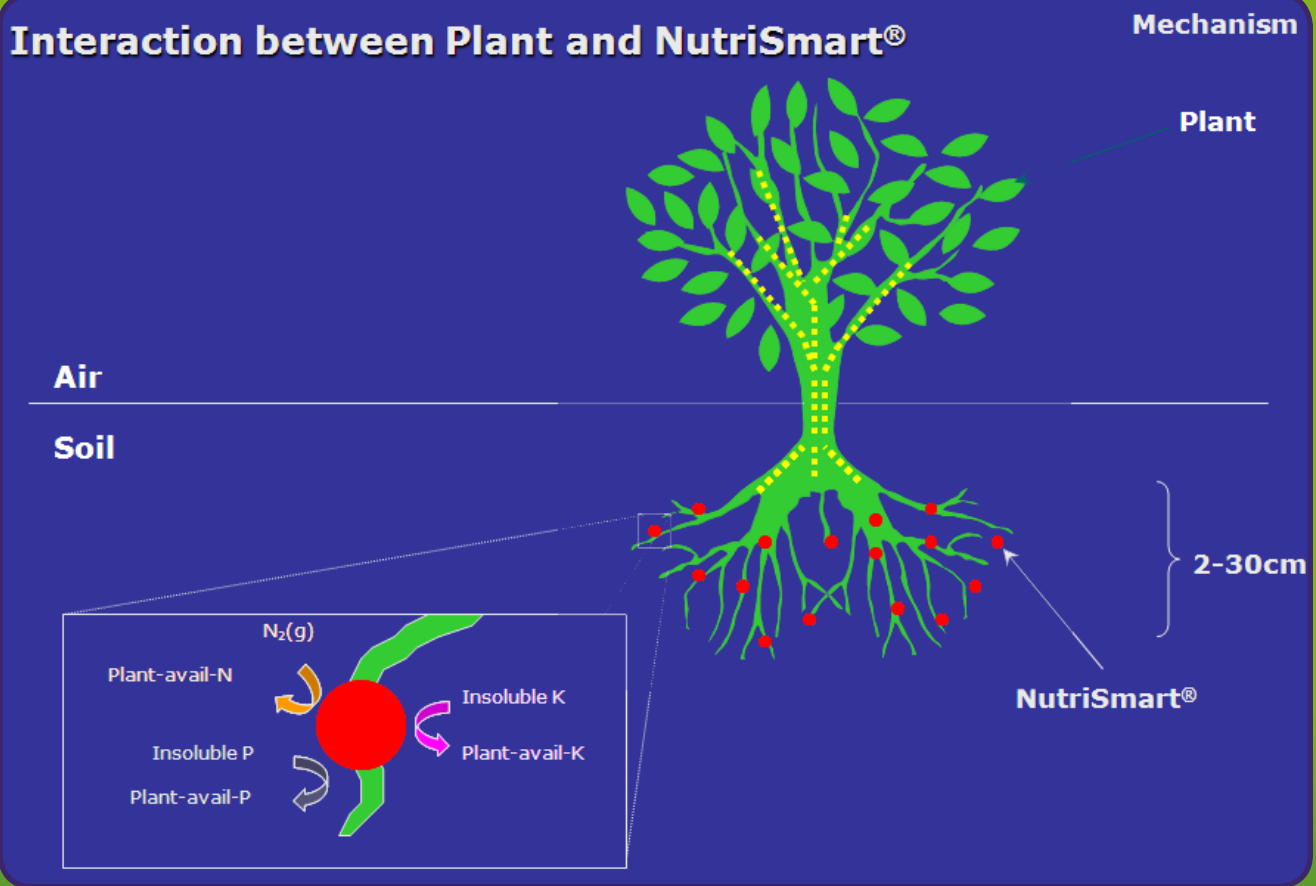

No fungicides were used on this crop.

Improved & more even tuber set under a NutriSmart program (7 weeks prior to harvest). The potatoes without it show less uniformity.

**MORE INFO :**

Potato yields with and without NutriSmart applied.
